

In the Claims:

Please amend claims 2-3, 5-8, 10-14, 16-22, 24-28, 30, 31, 33-36, and 38-42. Please cancel claims 1, 15 and 29. The claims are as follows:

1. (Canceled)

2. (Currently Amended) The circuit of claim [[1]] 3, wherein said second circuit node is ground.

3. (Currently Amended 1) ~~The circuit of claim 1, wherein said compensation circuit comprises a~~
circuit comprising:

a capacitor coupled between a first circuit node and a second circuit node and that leaks a
leakage current from said first circuit node to said second circuit node; and

a compensation circuit adapted to supply a compensatory current to compensate for said
leakage current to said first circuit node, said compensation circuit including an additional
capacitor connected between a voltage source and said first circuit node.

4. (Original) The circuit of claim 3, wherein the capacitance of said additional capacitor is about equal to the capacitance of said capacitor and the leakage of said additional capacitor is about equal to the leakage of said capacitor.

5. (Currently Amended) The circuit of claim [[1]] 3, ~~wherein said compensation circuit~~
~~comprises:~~

Appl. No.:10/707,123

~~wherein said voltage source is a voltage doubler, an additional capacitor and a voltage doubler, a first plate of said additional capacitor connected to said first circuit node, a second plate of said additional capacitor connected to an output of said voltage doubler, and an input to said voltage doubler connected to said first circuit node.~~

6. (Currently Amended) The circuit of claim ~~[[1]]~~ 3, wherein ~~said compensation circuit further comprises;~~

~~a current source connected between a voltage source and said first circuit node;~~

~~an additional capacitor connected between said second circuit node and~~ said voltage source comprises a voltage buffer, said voltage buffer adapted to generate a voltage across said additional capacitor ~~[[;]]~~ based on the voltage on said first circuit node; and

said compensation circuit including a current monitor connected to said voltage buffer and adapted to control an amount of current supplied from said current source to said first circuit node based on a leakage current from said additional capacitor to said second circuit node.

7. (Currently Amended) The circuit of claim ~~[[1]]~~ 6, wherein said current source supplies an amount of current to said first circuit node that is equal a leakage current of said additional capacitor times the capacitance of said capacitor divided by the capacitance of said additional capacitor.

8. (Currently Amended) The circuit of claim ~~1~~, wherein ~~said compensation circuit comprises~~ A circuit comprising:

Appl. No.:10/707,123

a capacitor coupled between a first circuit node and a second circuit node and that leaks a leakage current from said first circuit node to said second circuit node; and
a compensation circuit adapted to supply a compensatory current to compensate for said leakage current to said first circuit node, said compensation circuit including:

a current source connected between a voltage source and said first circuit node;

a sensing element connected between said capacitor and said second circuit node;

and

an operational amplifier, a first input of said amplifier connected to a third circuit node between said capacitor and said sensing element, a second input of said amplifier connected to said second circuit node, and the output of said amplifier adapted to control an amount of current supplied from said current source to said first circuit node based on an amount of said leakage current.

9. (Original) The circuit of claim 8, wherein said sensing element is a resistor.

10. (Currently Amended) ~~The circuit of claim 1, wherein said compensation circuit comprises A~~
circuit comprising:

a capacitor coupled between a first circuit node and a second circuit node and that leaks a leakage current from said first circuit node to said second circuit node; and

a compensation circuit adapted to supply a compensatory current to compensate for said leakage current to said first circuit node, said compensation circuit including:

a current source connected between a voltage source and said first circuit node;

Appl. No.:10/707,123

a voltage buffer connected to said first circuit node and adapted to sense a voltage on said first circuit node;

a time delay circuit connected between said voltage buffer and a first input of an operational amplifier, a second input of said operational amplifier connected between said voltage buffer and said time delay circuit, said operational amplifier generating an output signal; and

said output signal of said operational amplifier coupled to said current source in order to control an amount of current supplied from said current source to said first circuit node based on said output signal of said operational amplifier.

11. (Currently Amended) ~~The circuit of claim 1, wherein said compensation circuit comprises; A~~
circuit comprising:

a capacitor coupled between a first circuit node and a second circuit node and that leaks a leakage current from said first circuit node to said second circuit node; and

a compensation circuit adapted to supply a compensatory current to compensate for said leakage current to said first circuit node, said compensation circuit including:

a reference resistor coupled between said first and second circuit nodes;

a current reference circuit coupled to the gate of a pass gate, the source/drains of said pass gate coupled between a voltage source and said first circuit node;

a digital to analog converter connected to said current reference and adapted to control a voltage applied by said current reference to said gate of said pass gate; and

a leakage reference circuit adapted to sense a voltage on said second node, said current reference including a reference capacitor, said leakage reference circuit generating a reference current proportional to the ratio of the capacitance of said reference capacitor to the capacitance of said capacitor and adapted to supply an amount of compensating current to said first circuit node that is about equal to said leakage current.

12. (Currently Amended) The circuit of claim [[1]] 11, wherein said compensation circuit comprises; is adapted to either adapted to supply an amount of compensating current to said first circuit node that is about equal to said leakage current or

~~a reference resistor coupled between said first and second circuit nodes;~~

~~a current reference circuit coupled to the gate of a pass gate, the source/drains of said pass gate coupled between a voltage source and said first circuit node;~~

~~a digital to analog converter connected to said current reference and adapted to control a voltage applied by said current reference to said gate of said pass gate; and~~

~~a leakage reference circuit adapted to sense a voltage on said second node, said current reference including a reference capacitor, said leakage reference circuit generating a reference current proportional to the ratio of the capacitance of said reference capacitor to the capacitance of said capacitor and adapted to drain an amount of current from said current reference circuit such that said pass gate supplies an amount of compensating current to said first circuit node that is about equal to said leakage current.~~

13. (Currently Amended) The circuit of claim ~~[[1]]~~ 3, wherein said capacitor is selected from the group consisting of a PFET capacitor, an NFET capacitor, a metal-insulator-metal capacitor, a trench capacitor, a deep trench capacitor, an electrolytic capacitor, a tantalum capacitor, a mica capacitor and a ceramic capacitor.

14. (Currently Amended) The circuit of claim ~~[[1]]~~ 3, further including:

means for supplying a correction current to said first node at a correction frequency;

means for switching said compensatory current off when said correction frequency is greater than a multiple of an equivalent frequency of said compensatory current and for switching said compensatory current on when said correction frequency is less than said multiple of said equivalent compensatory current frequency; and

wherein said equivalent compensatory current frequency is defined as one divided by the effective resistance of said capacitor attributable to said leakage current, times the capacitance of said capacitor.

15. (Canceled)

16. (Currently Amended) The circuit of claim ~~[[15]]~~ 17, wherein said second circuit node is ground.

17. (Currently Amended) ~~The circuit of claim 15, wherein said compensation circuit comprises:~~
A phase locked loop circuit, comprising:

Appl. No.:10/707,123

an output of a phase detector connected to an input of a charge pump;
an input of a compensated loop filter connected to an output of said charge pump;
an input of a voltage controlled oscillator connected to an output of said compensated
loop filter;
an output of said voltage controlled oscillator connected to an input of said phase
detector; and
said compensated loop filter comprising:
a capacitor coupled between a first circuit node and a second circuit node that
leaks a leakage current from said first circuit node to said second circuit node;
a secondary resistor connected between said first circuit node and a secondary
capacitor, said secondary capacitor connected between said secondary resistor and said
second circuit node; and
a compensation circuit adapted to supply a compensatory current to compensate
for said leakage current from said first circuit node, said compensation circuit including
an additional capacitor connected between a voltage source and said first circuit node.

18. (Currently Amended) The circuit of claim [[15]] 17, wherein the capacitance of said additional capacitor is about equal to the capacitance of said capacitor and the leakage of said additional capacitor is about equal to the leakage current of said capacitor.

19. (Currently Amended) The circuit of claim [[15]] 17, wherein ~~said compensation circuit~~
~~comprises:~~

Appl. No.:10/707,123

~~wherein said voltage source is a voltage doubler, an additional capacitor and a voltage doubler, a first plate of said additional capacitor connected to said first circuit node, a second plate of said additional capacitor connected to an output of said voltage doubler, and an input of said voltage doubler connected to said first circuit node.~~

20. (Currently Amended) The circuit of claim ~~[[15]]~~ 17, wherein ~~said compensation circuit comprises;~~

~~a current source connected between a voltage source and said first circuit node;~~
~~an additional capacitor connected between said second circuit node and said voltage~~
source comprises a voltage buffer, said voltage buffer adapted to generate a voltage across said additional capacitor ~~[[;]]~~ based on the voltage on said first circuit node; and
said compensation circuit further including a current monitor connected to said voltage buffer and adapted to control an amount of current supplied from said current source to said first circuit node based on a leakage current from said additional capacitor to said second circuit node.

21. (Currently Amended) The circuit of claim ~~[[15]]~~ 20, wherein said current source supplies an amount of current to said first circuit node that is equal a leakage current of said additional capacitor times the capacitance of said capacitor divided by the capacitance of said additional capacitor.

22. (Currently Amended) ~~The circuit of claim 15, wherein said compensation circuit comprises;~~
A phase locked loop circuit, comprising:

an output of a phase detector connected to an input of a charge pump;
an input of a compensated loop filter connected to an output of said charge pump;
an input of a voltage controlled oscillator connected to an output of said compensated
loop filter;
an output of said voltage controlled oscillator connected to an input of said phase
detector; and
said compensated loop filter comprising:
a capacitor coupled between a first circuit node and a second circuit node that
leaks a leakage current from said first circuit node to said second circuit node;
a secondary resistor connected between said first circuit node and a secondary
capacitor, said secondary capacitor connected between said secondary resistor and said
second circuit node; and
a compensation circuit adapted to supply a compensatory current to compensate
for said leakage current from said first circuit node, said compensation circuit including:
a current source connected between a voltage source and said first circuit
node;
a sensing element connected between said capacitor and said second
circuit node; and
an operational amplifier, a first input of said amplifier connected to a third
circuit node between said capacitor and said sensing element, a second input of
said amplifier connected to said second circuit node, and the output of said

amplifier adapted to control an amount of current supplied from said current source to said first circuit node based on an amount of said leakage current.

23. (Original) The circuit of claim 22, wherein said sensing element is a resistor.

24. (Currently Amended) ~~The circuit of claim 15, wherein said compensation circuit comprises:~~

A phase locked loop circuit, comprising:

an output of a phase detector connected to an input of a charge pump;

an input of a compensated loop filter connected to an output of said charge pump;

an input of a voltage controlled oscillator connected to an output of said compensated

loop filter;

and output of said voltage controlled oscillator connected to an input of said phase

detector; and

said compensated loop filter comprising:

a capacitor coupled between a first circuit node and a second circuit node that leaks a leakage current from said first circuit node to said second circuit node;

a secondary resistor connected between said first circuit node and a secondary capacitor, said secondary capacitor connected between said secondary resistor and said second circuit node; and

a compensation circuit adapted to supply a compensatory current to compensate for said leakage current from said first circuit node, said compensation circuit including:

a current source connected between a voltage source and said first circuit node;

a voltage buffer connected to said first circuit node and adapted to sense a voltage on said first circuit node;

a time delay circuit connected between said voltage buffer and a first input of an operational amplifier, a second input of said operational amplifier connected between said voltage buffer and said time delay circuit, said operational amplifier generating an output signal; and

said output signal of said operational amplifier coupled to said current source in order to control an amount of current supplied from said current source to said first circuit node based on said output signal of said operational amplifier.

25. (Currently Amended) ~~The circuit of claim 15, wherein said compensation circuit comprises;~~

A phase locked loop circuit, comprising:

an output of a phase detector connected to an input of a charge pump;

an input of a compensated loop filter connected to an output of said charge pump;

an input of a voltage controlled oscillator connected to an output of said compensated

loop filter;

and output of said voltage controlled oscillator connected to an input of said phase detector; and

said compensated loop filter comprising:

a capacitor coupled between a first circuit node and a second circuit node that leaks a leakage current from said first circuit node to said second circuit node;

a secondary resistor connected between said first circuit node and a secondary capacitor, said secondary capacitor connected between said secondary resistor and said second circuit node; and

a compensation circuit adapted to supply a compensatory current to compensate for said leakage current from said first circuit node, said compensation circuit including:

a reference resistor coupled between said first and second circuit nodes;

a current reference circuit coupled to the gate of a pass gate, the source/drains of said pass gate coupled between a voltage source and said first circuit node;

a digital to analog converter connected to said current reference and adapted to control a voltage applied by said current reference to said gate of said pass gate; and

a leakage reference circuit adapted to sense a voltage on said second node, said current reference including a reference capacitor, said leakage reference circuit generating a reference current proportional to the ratio of the capacitance of said reference capacitor to the capacitance of said capacitor and adapted to supply an amount of compensating current to said first circuit node that is about equal to said leakage current.

26. (Currently Amended) The circuit of claim [[15]] 25, wherein said compensation circuit comprises; is adapted to either to supply an amount of compensating current to said first circuit node that is about equal to said leakage current or

~~a reference resistor coupled between said first and second circuit nodes;~~

~~a current reference circuit coupled to the gate of a pass gate, the source/drains of said pass gate coupled between a voltage source and said first circuit node;~~

~~a digital to analog converter connected to said current reference and adapted to control a voltage applied by said current reference to said gate of said pass gate; and~~

~~a leakage reference circuit adapted to sense a voltage on said second node, said current reference including a reference capacitor, said leakage reference circuit generating a reference current proportional to the ratio of the capacitance of said reference capacitor to the capacitance of said capacitor and adapted to drain an amount of current from said current reference circuit such that said pass gate supplies an amount of compensating current to said first circuit node that is about equal to said leakage current.~~

27. (Currently Amended) The circuit of claim [[15]] 17, wherein said capacitor is selected from the group consisting of a PFET capacitor, an NFET capacitor, a metal-insulator-metal capacitor, a trench capacitor, a deep trench capacitor, an electrolytic capacitor, a tantalum capacitor, a mica capacitor and a ceramic capacitor.

28. (Currently Amended) The circuit of claim [[15]] 17, further including:

means for supplying a correction current to said first node at a correction frequency;

means for switching said compensatory current off when said correction frequency is greater than a multiple of an equivalent frequency of said compensatory current and for switching said compensatory current on when said correction frequency is less than said multiple of said equivalent compensatory current frequency; and

wherein said equivalent compensatory current frequency is defined as one divided by the effective resistance of said capacitor attributable to said leakage current, times the capacitance of said capacitor.

29. (Canceled)

30. (Currently Amended) The method of claim ~~[[29]]~~ 31, wherein said second circuit node is ground.

31. (Currently Amended) ~~The method of claim 29, wherein said compensation circuit comprises:~~
A method of compensating a capacitor that leaks current between a first circuit node and a second circuit node, comprising:

providing said capacitor;

coupling said capacitor between said first circuit node and said second circuit node; and

coupling to said first circuit node, a compensation circuit adapted to supply a

compensatory current to compensate for said leakage current to said first circuit node, said

compensation including an additional capacitor connected between a voltage source and said first circuit node.

Appl. No.:10/707,123

32. (Original) The method of claim 31, wherein the capacitance of said additional capacitor is about equal to the capacitance of said capacitor and the leakage of said additional capacitor is about equal to the leakage of said capacitor.

33. (Currently Amended) The method of claim ~~[[29]]~~ 31, ~~wherein said compensation circuit comprises:~~ wherein said voltage source is a voltage doubler, an additional capacitor and a voltage doubler, a first plate of said additional capacitor connected to said first circuit node, a second plate of said additional capacitor connected to an output of said voltage doubler, and an input to said voltage doubler connected to said first circuit node.

34. (Currently Amended) The method of claim ~~[[29]]~~ 31, ~~wherein said compensation circuit comprises;~~

~~a current source connected between a voltage source and said first circuit node;~~

~~an additional capacitor connected between said second circuit node and~~ said voltage source comprises a voltage buffer, said voltage buffer adapted to generate a voltage across said additional capacitor ~~[[;]]~~ based on the voltage on said first circuit node; and

said compensation circuit including a current monitor connected to said voltage buffer and adapted to control an amount of current supplied from said current source to said first circuit node based on a leakage current from said additional capacitor to said second circuit node.

35. (Currently Amended) The circuit of claim ~~[[29]]~~ 34, wherein said current source supplies an amount of current to said first circuit node that is equal a leakage current of said additional capacitor times the capacitance of said capacitor divided by the capacitance of said additional capacitor.

36. (Currently Amended) ~~The method of claim 29, wherein said compensation circuit comprises:~~
A method of compensating a capacitor that leaks current between a first circuit node and a second circuit node, comprising:

providing said capacitor;

coupling said capacitor between said first circuit node and said second circuit node; and

coupling to said first circuit node, a compensation circuit adapted to supply a compensatory current to compensate for said leakage current to said first circuit node, said compensation including:

a current source connected between a voltage source and said first circuit node;

a sensing element connected between said capacitor and said second circuit node;

and

an operational amplifier, a first input of said amplifier connected to a third circuit node between said capacitor and said sensing element, a second input of said amplifier connected to said second circuit node, and the output of said amplifier adapted to control an amount of current supplied from said current source to said first circuit node based on an amount of said leakage current.

37. (Original) The method of claim 36, wherein said sensing element is a resistor.

38. (Currently Amended) ~~The method of claim 29, wherein said compensation circuit comprises:~~

A method of compensating a capacitor that leaks current between a first circuit node and a second circuit node, comprising:

providing said capacitor;

coupling said capacitor between said first circuit node and said second circuit node; and

coupling to said first circuit node, a compensation circuit adapted to supply a compensatory current to compensate for said leakage current to said first circuit node, said compensation including:

a current source connected between a voltage source and said first circuit node;

a voltage buffer connected to said first circuit node and adapted to sense a voltage on said first circuit node;

a time delay circuit connected between said voltage buffer and a first input of an operational amplifier, a second input of said operational amplifier connected between said voltage buffer and said time delay circuit, said operational amplifier generating an output signal; and

said output signal of said operational amplifier coupled to said current source in order to control an amount of current supplied from said current source to said first circuit node based on said output signal of said operational amplifier.

39. (Currently Amended) ~~The method of claim 29, wherein said compensation circuit comprises;~~

A method of compensating a capacitor that leaks current between a first circuit node and a second circuit node, comprising:

providing said capacitor;

coupling said capacitor between said first circuit node and said second circuit node; and

coupling to said first circuit node, a compensation circuit adapted to supply a compensatory current to compensate for said leakage current to said first circuit node, said compensation including:

a reference resistor coupled between said first and second circuit nodes;

a current reference circuit coupled to the gate of a pass gate, the source/drains of said pass gate coupled between a voltage source and said first circuit node;

a digital to analog converter connected to said current reference and adapted to control a voltage applied by said current reference to said gate of said pass gate; and

a leakage reference circuit adapted to sense a voltage on said second node, said current reference including a reference capacitor, said leakage reference circuit generating a reference current proportional to the ratio of the capacitance of said reference capacitor to the capacitance of said capacitor and adapted to supply an amount of compensating current to said first circuit node that is about equal to said leakage current.

40. (Currently Amended) The method of claim [[29]] 39, wherein said compensation circuit comprises; is adapted to either supply an amount of compensating current to said first circuit node that is about equal to said leakage current or

~~a reference resistor coupled between said first and second circuit nodes;~~
~~a current reference circuit coupled to the gate of a pass gate, the source/drains of said~~
~~pass gate coupled between a voltage source and said first circuit node;~~
~~a digital to analog converter connected to said current reference and adapted to control a~~
~~voltage applied by said current reference to said gate of said pass gate; and~~
~~a leakage reference circuit adapted to sense a voltage on said second node, said current~~
~~reference including a reference capacitor, said leakage reference circuit generating a reference~~
~~current proportional to the ratio of the capacitance of said reference capacitor to the capacitance~~
~~of said capacitor and adapted drain an amount of current from said current reference circuit such~~
~~that said pass gate supplies an amount of compensating current to said first circuit node that is~~
~~about equal to said leakage current.~~

41. (Currently Amended) The method of claim ~~[[29]]~~ 31, wherein said capacitor is selected from the group consisting of a PFET capacitor, an NFET capacitor, a metal-insulator-metal capacitor, a trench capacitor, a deep trench capacitor, an electrolytic capacitor, a tantalum capacitor, a mica capacitor and a ceramic capacitor.

42. (Currently Amended) The method of claim ~~[[29]]~~ 31, further including:

supplying a correction current to said first node at a correction frequency;
switching said compensatory current off when said correction frequency is greater than a multiple of an equivalent frequency of said compensatory current and switching said

compensatory current on when said correction frequency is less than said multiple of said equivalent compensatory current frequency; and

wherein said equivalent compensatory current frequency is defined as one divided by the effective resistance of said capacitor attributable to said leakage current, times the capacitance of said capacitor.
